

Ignition Gap interface, to avoid the switch off of the aftermarket radio

Art. Nr: SI-IGN-01

General

IGNITION GAP is a voltage stabilizer to avoid the battery voltage fall during the vehicle ignition. Thanks to this interface it is possible to keep active, during the ignition, some devices with a maximum consumption of 500mA.

Technical specifications

Stabilized Power Duration: 20 ms with a maximum consumption of 500mA.

Maximum Consumption Allowed: <500mA for a continuous use
